APEC STORE SALES ANALYTICS PROJECT

Sales Performance & Revenue Dashboard Report

Project Type	Business Intelligence & Sales Analytics
Dashboard Tool	Dashboard screenshots supplied by the student
Report Focus	Revenue, order volume, customer segments, channels, product SKUs, and geography

Prepared as an academic project report

This report uses the two dashboard images provided. The findings are descriptive interpretations of the visible charts; the underlying dataset was not supplied, so no additional calculations have been invented.

1. Project Overview

The Apec Store Sales Analytics Project presents sales and revenue information in dashboard form. It is intended to help a business understand sales performance, compare sales channels, review order patterns, examine customer segments, and identify areas for further investigation.

Project Objectives

• Summarize key performance indicators (KPIs) such as total revenue, order count, average age, and average revenue per order.

• Compare sales contribution across channels and business-to-business (B2B) versus business-to-consumer (B2C) sales.

• Explore revenue trends by quarter and month, and compare performance across product SKUs.

• Review customer characteristics such as age group, gender, and clothing size.

• Use geographic distribution to support regional sales planning, subject to validation of location data.

Scope and Data Note

The analysis is based only on the two screenshots supplied. Some chart labels are abbreviated or partially hidden by scrolling, and the screenshots show different KPI sets and filters. Therefore, the figures are reported as displayed and should not be treated as reconciled totals until the original dataset and dashboard definitions are checked.

2. Dashboard 1 — Revenue Analysis

This dashboard emphasizes average revenue per order, the balance between B2B and B2C sales counts, and customer-related breakdowns.

Key figures visible in the dashboard

Metric	Displayed value	Interpretation
Average revenue per order	679	Typical order revenue measure shown on the dashboard.
B2B sales count	186	Count displayed for business-to-business sales.
B2C sales count	31K	B2C count is much larger than B2B in this view.
AOV over time	682.07	Average order value measure shown in the KPI card.

Observations

• The B2C sales count dominates the B2B count in the displayed donut chart (approximately 99.4% versus 0.6%).

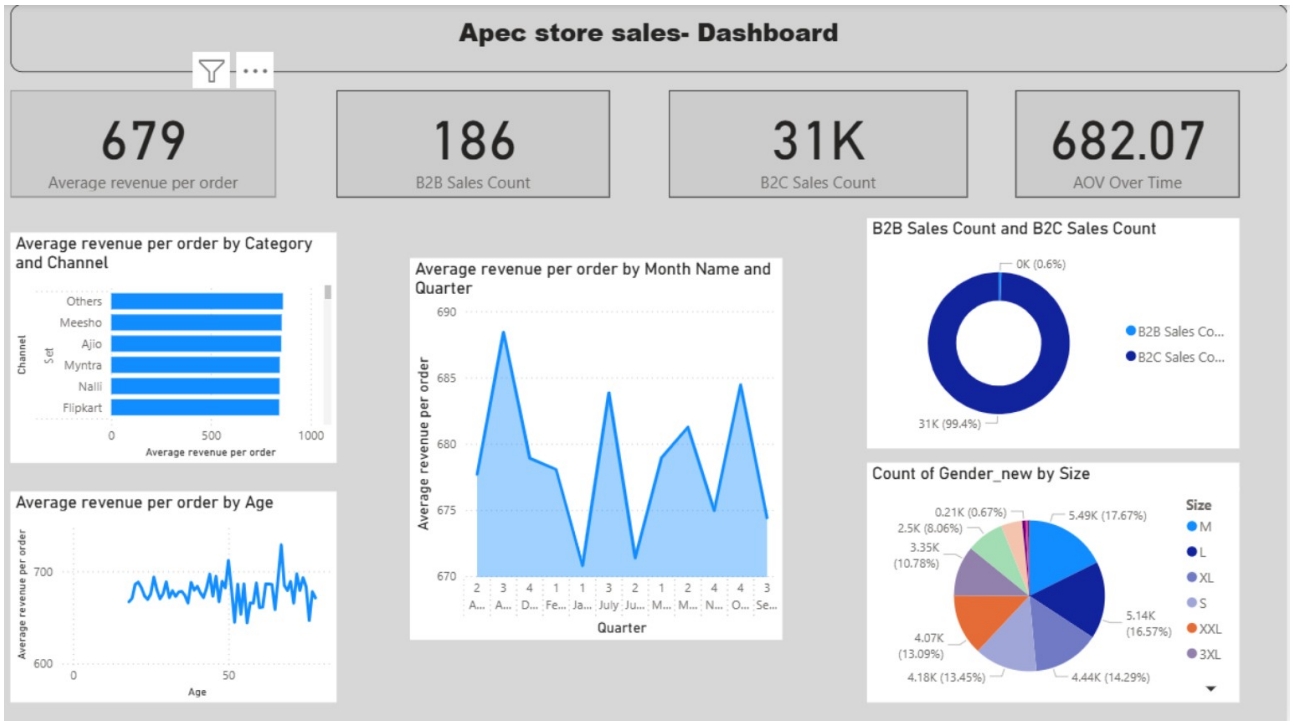

• Average revenue per order by channel appears relatively similar across the visible channels, though the chart is scrollable and may omit additional categories.

• The monthly/quarterly line chart fluctuates, with visible peaks near 688 and lower points around 671. This suggests variation over time rather than a constant average.

• The age-based chart shows average revenue per order moving within a fairly narrow band for many ages, with some higher and lower points. Individual spikes should be checked against order counts before drawing conclusions.

• The size chart shows several meaningful customer-size segments; the largest visible slices are around 5.49K and 5.14K counts.

3. Dashboard 2 — Sales Analysis

This dashboard focuses on total revenue, order totals, unique orders, average customer age, channel-level sales, quarterly sales, SKU contribution, gender split, and geographic distribution.

Metric	Displayed value	Interpretation
Total revenue	50K	Total amount displayed; the unit/currency is not specified in the screensh
Total orders	80	Order count shown in the KPI card.
Unique orders	78	Unique-order measure shown; its definition should be confirmed.
Average age	42.29	Average age shown for the selected dashboard view.

Observations

• Ajio and Myntra have the largest visible channel sales bars, followed by Meesho. Amazon, Others, and Flipkart are much smaller in this displayed view.

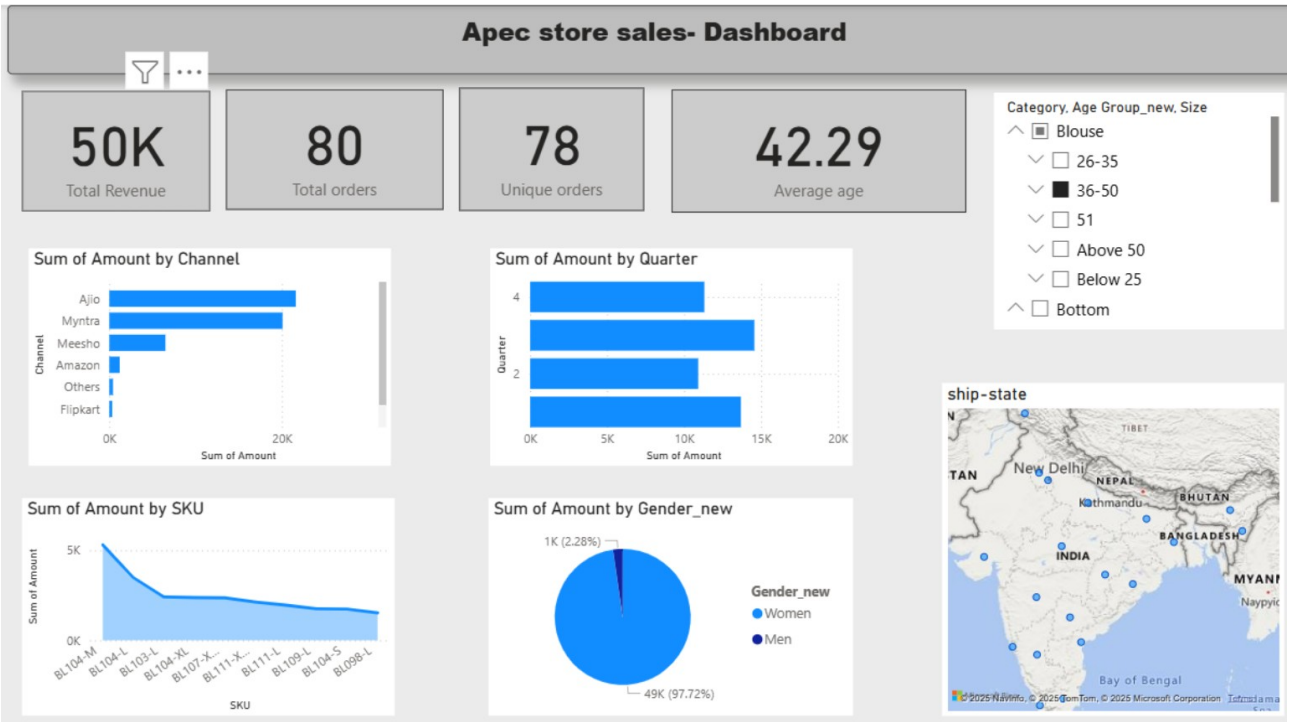

• The quarterly chart shows uneven sales across four quarters; one quarter is visibly higher than the others. The original data is needed to assign exact quarter values confidently.

• The SKU chart declines from the leading SKU to lower-ranked SKUs, indicating that sales amount is concentrated among a subset of the visible products.

• The gender chart shows Women at approximately 49K (97.72%) and Men at around 1K (2.28%) in the displayed view. This unusually large gap should be checked for filters, category definitions, and data quality before business decisions are made.

• The map visual displays points across India and nearby areas. Regional conclusions require confirmation that the plotted ship-state values and geographic fields are correctly mapped.

Dashboard Screenshot

4. Business Insights and Recommendations

Channel strategy

Review Ajio and Myntra performance to understand what is driving their higher displayed sales. Compare margins, returns, discounts, and advertising costs before increasing investment.

Customer segmentation

Use age group, gender, and size filters to compare revenue and order counts. Verify that each segment has enough records to support reliable conclusions.

Quarterly planning

Investigate the strongest and weakest quarters by comparing promotions, stock availability, seasonality, pricing, and delivery performance.

Product/SKU management

Identify high-contribution SKUs and monitor inventory availability. Review low-contribution SKUs for pricing, product visibility, and stock decisions.

Order-value improvement

Track average order value alongside conversion, order count, and profit margin. Test bundles or relevant cross-sells only where they support customer needs and profitability.

Geographic operations

Validate state names and map coordinates, then use confirmed regional sales to plan delivery coverage and localized campaigns.

Data quality checks

Reconcile total revenue, order count, unique orders, and B2B/B2C counts across dashboards. Check duplicates, missing values, filter states, currency, and measure definitions.

5. Suggested KPIs for Future Improvement

KPI	Why it matters
Total revenue	Measures sales value for the selected period.
Average order value (AOV)	Shows average revenue per order; define numerator and denominator consistently
Number of orders	Measures transaction/order volume.
Gross margin / profit	Shows whether sales generate profit, not only revenue.
Channel contribution %	Compares each channel's share of total sales.
Return / cancellation rate	Highlights service, product, or fulfilment problems.
Repeat customer rate	Measures customer retention when customer identifiers are available.
Quarter-over-quarter growth	Tracks changes in sales between comparable quarters.
Inventory availability	Helps explain lost sales and SKU performance.

6. Conclusion

The two Apec Store dashboards provide a useful visual summary of sales channels, order value, quarterly movement, customer segments, SKUs, and geographic spread. The visible charts suggest that B2C volume is much larger than B2B, Ajio and Myntra are leading channels in the sales view, and sales vary across quarters and SKUs. Before making operational or financial decisions, the underlying dataset and KPI definitions should be validated, especially where dashboard totals differ or segment distributions appear unusually concentrated.

Prepared from the dashboard screenshots provided by the student. This is a descriptive academic report, not an audited financial statement.
